

# FormSafe™ for Microsoft® Access™

## Data Security is a Global Requirement

Whether you work for a global enterprise or a growing business with a few employees, the ability to secure private and sensitive data is universal. And sensitive data isn't just contained within a few select systems, it's everywhere. Including Microsoft Access. If your business relies on Microsoft Access to store and manage important information, including private or sensitive data, it is critical to ensure you take measures to protect that information. Solid database design and security implementation is step one, and secondly, locking down specific information at the user level. But doing so in Microsoft Access has traditionally required numerous user-specific forms, or custom VB coding to manage field-level security.

FormSafe for Microsoft Access provides a simple yet powerful utility to dynamically decide what fields and controls on a form need to be hidden, disabled, or obscured, all at the user level. With FormSafe, you can ensure each user is granted visibility to only those fields they need to access, helping you comply with government privacy regulations while eliminating the need to maintain multiple versions of the same form for each user or role.

## Rapid Deployment

FormSafe is designed to integrate with your existing database applications, and implementation is remarkably fast. Add a single line of VB code (provided by FormSafe) to each of the forms you need to secure. Then set up the rules you want to enforce for each form, field, and set of users. That's it. When a form is opened, FormSafe will detect the current user, and hide, disable, or obscure each configured field before the form is visible to the user.

## Rapid Performance, Broad Compatibility

FormSafe won't degrade the performance of your database, either. Each form will take about 1 second longer to load. Moreover, if you are planning to upsize your back end to MySQL Server or Microsoft SQL Server, FormSafe will continue to protect the data in your Microsoft Access front-end forms.

## A Small Preventative Investment

A small investment to prevent unauthorized access to your data can go a long way. Minimize your legal risk and protect your long term growth by ensuring your confidential and sensitive employee, customer, and other business data is appropriately secured. FormSafe helps make sure you protect your data, and minimize the level of effort and cost to do so.

## The Benefits

- Increase security at the user level
- Reduce development time and effort
- Eliminate duplicate forms or hard coding to hide fields by user
- Ensure compliance with government privacy regulations
- Easily integrates with any Access database

## What's Included

- Hide, disable, or obscure any Access control (button, label, text box, etc.) at runtime
- Support for first-level subforms
- Visual Basic expertise not required
- Configure rules by user or groups of users
- Full source code access

## Requirements

- Microsoft Access 2000, 2002, 2003, or 2007
- Supports mdb, mde, accdb, and accde formats
- Compatible with Access runtime versions (optional)

## OpenGate Software Inc.
